

Sprint 1 Goal:

Validate that students complete the onboarding and first chapter journey, and find the quiz-to-unlock mechanic clear and motivating.

This goal is specific, measurable, and focused on learning the core of your riskiest assumption: Will they use it the way we intend?

The Filled Gaps: Sprint 1 Feature Set

1. Core User Journey (The "Must Have")

- Student Signup/Login: Simple. Email/Password only. Collect *only* essential data: Name, School (dropdown), intended exam year.
- Onboarding & Initial Assessment:
 - Gap Fill: This isn't just a quiz. It's the first taste of "personalization."
 - Flow: After signup, a clear screen explains: "We'll ask 5 questions to find your perfect starting point. This helps us give you the right material."
 - The Quiz: 5 multiple-choice questions from across the A-level syllabus. Based on the score, they are assigned a Level (Foundational, Core, Advanced). This determines their starting chapter.
 - Result Screen: Clearly shows their level and explains what it means. "Great! We'll start you with Core concepts to strengthen your foundation." -> This builds immediate value.
- The Dashboard (Home Screen):
 - Gap Fill: This is a motivation engine, not just a menu.
 - Components:
 1. Welcome & Streak Counter: "Welcome, [Name]! 3-Day Streak"
 2. Current Chapter Card: Large button showing the chapter they are on. This is the primary call-to-action.
 3. Progress Bar: Overall course completion (e.g., "5% Complete").
 4. Next Chapter Card: Shows the next chapter, clearly marked as "Locked" with a tooltip: "Score 80% on the previous quiz to unlock."
- Chapter Content Screen: Text and images only. Clean, readable, broken into small sections.
- End-of-Chapter Quiz:

- Gap Fill: This is the core mechanic. It must feel consequential.
- Flow: 5 questions. A passing score (e.g., 80%) triggers a clear "Chapter Complete!" celebration screen.
- The Key Motivator: On the success screen, include this text: "Congratulations! You can now tackle questions like [Past Paper Code, Question Number]." -> This directly links effort to exam success.
- Failure Flow: If they score below 80%, they see: "Let's review that again. You can reread the chapter or try a different quiz on this topic." -> This is the "proactive intervention" we discussed.

2. Teacher Dashboard (The "Simplest Viable Tool")

- Gap Fill: You must include a teacher view to enable your distribution channel.
- Features:
 1. Class View: A simple list of students.
 2. Progress Column: Each student has a status indicator:
 - Green (On Track): Actively completing chapters.
 - Yellow (Behind): Started but progress has stalled.
 - Red (At Risk): Failed a quiz multiple times or hasn't logged in.
 3. Drill-Down: Clicking a student shows their specific chapter progress and quiz scores.
- Why this works: It provides immense value (saving time on grading and identifying struggling students) with minimal build effort. This is what makes a teacher recommend ATLAS.

3. Admin Backend (The "Necessary Evil")

- Features: A simple interface to:
 - View all users (students/teachers).
 - Deactivate accounts.
 - View platform analytics (total users, active users, total quizzes taken). - *This is for your 40% WAU metric.*

4. Success Metrics (The "Measuring Sticks")

- Primary Metric (Goal): Chapter 1 Completion Rate. What % of users who sign up finish Chapter 1 and pass its quiz? This is your leading indicator for engagement.
- Secondary Metrics:
 - Quiz Pass/Fail Rate: Are the quizzes at the right difficulty?
 - Weekly Active Users (WAU): Baseline number for future sprints.
 - Teacher Actions: How many teachers log in and check their dashboard at least once a week?

Sprint 1 Action Plan: Week-by-Week

Week 1: Foundation & Setup

- Task: Finalize detailed database schema (PostgreSQL). Set up Node.js/Express backend with basic API routes (Auth, Get Chapters, Submit Quiz).
- Task: Build the initial assessment quiz and the first two chapters of content for one subject (e.g., Computer Science). This is your "minimal content."
- Goal: API endpoints are working; content is ready in the database.

Week 2: Core Development

- Task: Develop the student frontend (React Native): Signup, Login, Assessment, Dashboard, Chapter Screen.
- Task: Implement the quiz engine and unlocking logic on the backend.
- Goal: A student can complete the entire journey from signup to completing Chapter 1 on a dev device.

Week 3: Teacher View & Polish

- Task: Build the simple Teacher Dashboard (class list with status indicators).
- Task: Build the basic Admin panel.
- Task: Polish the UI, add loading states, and handle errors.
- Goal: All user types (Student, Teacher, Admin) have functional screens.

Week 4: Testing & Deployment

- Task: Rigorous testing. Recruit 5 students and 2 teachers to try the app on their devices. Watch them use it.
- Task: Fix critical bugs.
- Task: Deploy backend to Railway. Deploy database to Supabase. Generate APK for Android testing via Microsoft App Center.
- Goal: A stable, testable MVP is in the hands of your pilot users.

What We Explicitly Leave for Sprint 2:

- Payment processing.
- Complex gamification (leaderboards, points shop).
- Advanced teacher features (creating custom quizzes).

- A full content library for all subjects.
- In-app messaging or forums.
- iOS app (focus on Android first).
